

Leave Management — Staff Manual

For the office / admin person who records driver leave. This guide uses the exact field names and buttons shown on the **Leave Management** page.

1. What this page is for

The page is titled **Leave Management**, with the subtitle *"Mark driver leave & toggle holidays"*. You use it to do two main jobs:

- 1. **Record a driver's leave** for a single day or a range of days, using the **Mark Leave (Range)** form.
- 2. **Turn company-wide rest days and public holidays on or off**, using the **Holiday Calendar**.

At the top of the page there are three summary tiles that update automatically:

Tile	What it shows
On Leave Today	How many drivers are off today (e.g. "All drivers on duty" or "2 drivers off").
Next Holiday	The date and label of the next active holiday / rest day.
Active Drivers	The number of drivers currently in the roster ("In roster").

To leave this page, click **Back to Dashboard** in the top-right corner.

These tiles are read-only. They are a quick check, not buttons. If the numbers look wrong, refresh the page.

2. How to record a driver's leave

Use the **Mark Leave (Range)** card on the left. Its subtitle is *"Bulk register driver leave across multiple days"*. The same form is used whether the leave is one day or several days.

Step by step

1. **Driver** — open the dropdown (it starts on *"— Select driver —"*) and pick the driver. Each driver appears as **staff ID — name** (for example `TER 448 — MUHAMMAD ZULKIFLI BIN`), so you can tell apart drivers who share the same first name.
2. **Leave Type** — choose the reason for the leave from the dropdown (the five options are listed in the table below).
3. **Start Date** — pick the first day of leave. When the page opens, both date boxes are already filled in with **today's date** (Malaysia time), so for a single day off today you can leave them as they are.
4. **End Date** — pick the last day of leave. For one day only, set **End Date** the same as **Start Date**. For several days, set it to the final day; the page records every day in the range.
5. **Remarks (optional)** — type a short note if useful, for example `Family event` (this matches the placeholder text on the page). You can leave this blank.
6. Click the blue **Mark Leave** button.
7. A confirmation pop-up appears, e.g. *"Mark [driver] on [type] for 3 day(s) (start → end)?"*. Click **OK** to save, or **Cancel** to stop.
8. Wait for the result. The button shows *"Saving..."*, then a message appears under the button and a notice pops up in the top-right. A successful save reads like *"Saved 3 day(s) for TER 448 — ..."*.

The exact leave types the page offers

Option shown in dropdown	Meaning
AL · Annual	Annual leave
MC · Medical	Medical / sick leave
EL · Emergency	Emergency leave
UL · Unpaid	Unpaid leave

Option shown in dropdown	Meaning
OFF · Rest	Rest day (off duty)

What the page checks before saving

If something is missing or wrong, a red message appears under the button and nothing is saved. The page enforces:

- "*X Select a driver*" — you did not choose a driver.
- "*X Pick start and end dates*" — one of the date boxes is empty.
- "*X End must be $\geq$ start*" — the End Date is before the Start Date.

Already-marked days are handled for you. If some days in the range were already recorded, the result line says how many were saved and how many were "already marked" (skipped). You do not get duplicates, so it is safe to re-run a range. If any day fails, the message shows how many "failed" and turns into a warning.

3. Recording a public holiday or rest day for ALL drivers

Company-wide days off are handled in the **Holiday Calendar** card on the right. Its subtitle is "*Next 30 days — click toggle to enable / disable a holiday*".

Each line in the list is one date and shows:

- the **day of week and date** (e.g. WED · 11 Jun);
- a coloured **label badge** — one of **Public Holiday**, **Saturday Rest**, or **Sunday Rest**;
- the holiday's name; and
- a **toggle button** on the right showing either ✓ **Active** or ✗ **Disabled**.

How to turn a holiday / rest day on or off

1. Find the date in the **Holiday Calendar** list.

2. Click its toggle button. A button reading ✓ **Active** will switch the day off; a button reading ✕ **Disabled** will switch it on.
3. A confirmation pop-up appears, e.g. "Set 2026-06-11 (PH) to DISABLED?". Click **OK** to confirm.
4. The button shows "Saving...", then a notice confirms the change, e.g. "Holiday 2026-06-11 → DISABLED", and the list refreshes.

Important — what this card can and cannot do. You can only switch *existing* calendar entries on or off. The list is generated for the next 30 days; there is **no button on this page to create a brand-new holiday date from scratch**. If a holiday you expect is not in the list, raise it with whoever maintains the system — do not try to force it through the leave form.

When to use this instead of the leave form: use the **Holiday Calendar** for days that apply to *everyone* (a public holiday, a Saturday/Sunday rest day). Use the **Mark Leave (Range)** form for one specific driver's time off.

4. Viewing, editing, or cancelling an existing leave record

Be aware of what this page does **not** have, so you record things correctly the first time:

- There is **no list of individual leave records** on this page, and **no edit or delete / cancel button for a driver's leave**. Once you click **Mark Leave** and confirm, the leave is written to the system.
- The only "existing records" you can change here are **holiday / rest days**, by toggling them ✓ **Active** / ✕ **Disabled** in the **Holiday Calendar** (see Section 3).
- To check how many drivers are off *today*, read the **On Leave Today** tile at the top of the page.

Because there is no "undo" for driver leave on this screen, **double-check the driver, leave type, and dates in the confirmation pop-up before clicking OK**. If you record leave by mistake, contact your system administrator to correct it in the back-end — it cannot be removed from this page.

5. How leave connects to the rest of the system

Recording leave here is not just paperwork — it keeps the main **Dashboard** accurate.

The Dashboard has two alert cards that flag drivers who have not sent in their daily paperwork:

-  **Haven't submitted POD**
-  **Haven't submitted fuel today** — its subtitle reads *"Drivers with no fuel entry today · on-leave excluded"*.

A driver who is marked on leave is **left out of these "haven't submitted" alerts**. So:

- If you **record a driver's leave**, they will correctly drop off the alerts — no one chases a driver who is off.
- If you **forget to record leave**, an off-duty driver will keep showing as "haven't submitted", and the team may waste time chasing them.

Bottom line: recording leave promptly keeps the Dashboard's chase-up lists clean and trustworthy.

Tips — Do's and Don'ts

Do

- **Do** record leave as soon as you know about it, so the Dashboard alerts stay accurate (Section 5).
- **Do** read the confirmation pop-up carefully — it states the driver, leave type, number of days, and the date range.
- **Do** set **End Date** equal to **Start Date** for a single day off.
- **Do** use the **staff ID — name** shown in the dropdown to pick the right person when two drivers share a first name.
- **Do** wait for the green success message / notice before assuming the leave was saved.

- **Do** use the **Holiday Calendar** (not the leave form) for company-wide rest days and public holidays.

Don't

- **Don't** use the leave form for a holiday that affects everyone — toggle it in the **Holiday Calendar** instead.
- **Don't** assume you can edit or cancel a driver's leave on this page — you can't. Get the driver and dates right before confirming.
- **Don't** worry about re-running a date range — days already recorded are skipped, not duplicated.
- **Don't** ignore a red error message under the **Mark Leave** button; nothing is saved until it clears.
- **Don't** ignore a "Network error" or "Cannot reach server" notice — the save did not go through. Check your connection and try again.
- **Don't** expect a holiday date that isn't already in the 30-day list to appear by itself — ask your system administrator to add it.
