

Shipment Management — Staff Manual

For the office / admin person. How to set up each day's deliveries: import the delivery forms and assign drivers to lorries.

Button and field names in this guide are written **exactly** as they appear on the page, so you can match them on screen. Open the page with the title **CLF Shipment Management** at the top.

1. What this page is for

The **CLF Shipment Management** page is your **daily setup screen**. Each morning you use it to do two jobs:

- 1. **Import the day's deliveries** — upload one CSV delivery form per lorry. Each upload creates a lorry "card" on the page.
- 2. **Assign the drivers** — for each lorry card, pick the **Primary driver** (and a **Helper (optional)** if there is one) and save it.

Once a lorry is imported and a driver is assigned, the driver will see that shipment automatically in their POD form, and it shows up on the dashboard. You do not need to tell the driver anything by hand.

The parts of the screen

On screen	What it is
 Upload Delivery Form (CSV)	The upload box at the top. Below the title it says: <i>"Export the Shipment CSV from your system, then upload it here. One file per lorry."</i>
Choose CSV file...	The blue button you click to pick a file to upload.
Date	The date box. It opens on today's date . Change it to view another day's lorries.

↻ Refresh	Reloads the list of lorries for the chosen date.
Lorries / Shipments	The heading above the lorry cards. A small count (e.g. • 3) shows how many lorries are loaded.

Each lorry card shows the **lorry number** (large), the **shipment number** underneath, a delivered progress bar (e.g. 0 / 12 delivered), and a status tag in the top-right corner:

Tag	Meaning
Imported	The lorry has been uploaded but no driver assigned yet . This is your to-do.
Assigned	A driver has been saved to this lorry. Ready to go.
Done	All planned invoices on this lorry have been delivered.

2. Importing the daily delivery-form CSV

How to upload

1. Export the **Shipment CSV** for one lorry from your system. **One file per lorry**.
2. Click the blue **Choose CSV file...** button.
3. Pick the CSV file in the file window. The upload starts on its own — you do **not** need to click anything else.
4. A message pops up at the bottom: *Uploading "..."* — *verifying...* Wait a few seconds for the result. (Checking can take up to about 15 seconds.)
5. Repeat for the next lorry's file.

You can upload the **same file again** if you need to — the file picker is cleared after each try, so re-selecting the same file works.

What a **SUCCESSFUL** import looks like

You get a green message at the bottom like:

✓ Imported *[lorry number]* — *[number]* invoices.

A new lorry card then appears (or refreshes) in the **Lorries / Shipments** list below, tagged **Imported**. That lorry is now in the system. Move on to assigning a driver (Step 3).

Sometimes the green message ends with **(auto-recovered)**. That is normal — the system just had to re-read the file a second way. The import still succeeded; nothing extra is needed from you.

The "TOTAL ERROR" / mismatch message — what it means

If the file's numbers do not add up, the import is **rejected** and you see a red message like:

✗ TOTAL ERROR — invoices add up to RM *[parsed sum]* but the form TOTAL is RM *[form total]* (off by RM *[difference]*). NOT imported — please check the file.

What this means in plain words: the system added up every invoice line in the file, and that total did **not** match the TOTAL printed on the form. This is the system's safety check against a wrong, edited, or broken file. **Nothing was imported** — no lorry card is created.

What to do when it appears:

- 1. **Do not** assume it imported — it did not. Check the list; no new card means it was rejected.
- 2. **Re-check the file.** Open the original CSV and look for: a missing or extra invoice line, a typed-over amount, or the wrong file for that lorry.
- 3. Re-export a clean copy of the Shipment CSV from your system if anything looks edited.
- 4. Upload the corrected file again with **Choose CSV file...**
- 5. If it keeps failing on a file you believe is correct, send the file to your supervisor — do not hand-edit the totals to force it through.

Other red messages you might see

Message	What it means
---------	---------------

✗ Could not read this file — NOT imported.	The file could not be opened or read. Make sure you picked the right <code>.csv</code> file and that it is not corrupted, then try again.
✗ This file is empty — NOT imported.	The file has no content. Re-export it from your system.
Upload sent, but no confirmation yet. Tap ↻ Refresh in a moment to check.	The system was slow to reply. Wait a moment, click ↻ Refresh , and check whether the lorry card appeared. Do not upload the same file again straight away, or you may import it twice.

3. Assigning a Primary driver (and optional Helper)

Each lorry card has a crew area at the bottom with two boxes:

- **Primary driver** — required. This is the main driver of the lorry.
- **Helper (optional)** — optional. The second person / helper, if there is one. Leave it blank if there isn't.

Both boxes use a **Staff ID search picker**. The empty box shows the hint **Staff ID atau nama** ("Staff ID or name").

Steps

1. Find the correct lorry card (check the lorry number and shipment number).
2. Click in the **Primary driver** box.
3. Start typing the driver's **Staff ID** or their **name**. A short drop-down list appears showing matches, each as **Staff ID · Name**.
4. Click the correct person in the list. The box fills in with their Staff ID and name.
5. If there is a helper, do the same in the **Helper (optional)** box. Otherwise leave it blank.
6. Click the blue **Save assignment** button on that card.

On success you get a green message like:

Assigned *[shipment number]* → *[driver]* (+ *[helper]*)

The card's tag changes to **Assigned** and the page refreshes.

Important: You must **pick from the drop-down list**, not just type a name and stop. If you click **Save assignment** with no driver chosen, you'll see "*Pick a primary driver first.*" and nothing is saved. Re-do the box and choose a name from the list.

If the drop-down list is always empty, you may see "*Could not load driver list — assignment dropdowns may be empty.*" when the page loads. Click ↺ **Refresh** or reload the page; if it stays empty, tell your supervisor — the staff list isn't loading.

4. Deleting a wrongly-imported shipment

If you imported the wrong file, or imported the same lorry twice, you can remove a lorry card with the **Delete** button (the white/red button on the card, next to **Save assignment**).

Use this only to clean up a **mistaken import**. Do not delete a real lorry that is out delivering.

The 2-step confirmation

Step 1 — first confirm. When you click **Delete**, a box asks:

Delete shipment [*shipment number*]? This removes the lorry card and all its invoice rows. This cannot be undone.

Click OK to continue, or Cancel to stop.

Step 2 — second confirm (only if the lorry already has deliveries). If that shipment already has delivered invoices / POD records, the first delete is **blocked** and you get a second warning:

⚠ [*This shipment has delivered invoices.*] Delete ANYWAY? The lorry card and invoice rows are removed, but the delivered POD photo records are KEPT (driver KPI is unaffected).

- Click OK **only if you are sure** you want to remove it anyway.
- Click Cancel to keep it — you'll see "*Delete cancelled — POD records kept.*"

If a delete succeeds you get a green message like "*Deleted [shipment number] ([number] invoice rows removed)*", and the card disappears.

What gets removed vs what is kept

Removed	Kept
- The lorry card for that shipment - All its invoice rows (the planned deliveries)	- Any delivered POD photo records already submitted by the driver - The driver's KPI is unaffected

In short: deleting clears the shipment off this setup page, but it does **not** erase work the driver already did. The delivered/POD records stay so nobody loses credit. Deleting **cannot be undone** — if you delete by mistake, you'll have to import the file again and re-assign the driver.

5. How this feeds the rest of the system

Everything you set up here flows downstream automatically:

- **The driver's POD form:** once a shipment is imported and a driver is assigned, it **auto-loads in that driver's POD form**. The driver opens their form and the day's deliveries are already there — you do not send anything by hand.
- **The dashboard:** imported and assigned shipments **show up on the dashboard**, where progress (delivered / planned, failed, pending) updates as drivers complete deliveries. You can reach it from the ← **Dashboard** link at the top-right of this page.

So the order each morning is simply: **import every lorry's CSV** → **assign a Primary driver (and Helper if any)** → **Save assignment**. After that, drivers and the dashboard take over.

Tips / Common problems

Import error (red "TOTAL ERROR" or "Could not read")

- **Nothing was imported.** A red message means no lorry card was created — don't assume it worked.
- **Re-check the file:** the TOTAL ERROR means the invoice lines didn't add up to the form's TOTAL. Look for a missing/extra line or an edited amount, re-export a clean CSV, and upload again.
- **Never hand-edit totals** to push a file through. If a file you trust keeps failing, send it to your supervisor.

Wrong driver assigned

- Just fix the box and save again. Click the **Primary driver** (or **Helper (optional)**) box, type the correct Staff ID or name, **pick from the drop-down**, then click **Save assignment**. The new assignment replaces the old one.
- You do **not** need to delete the lorry just to change a driver — deleting is only for a wrong import.

"Pick a primary driver first."

- You clicked **Save assignment** without choosing a driver from the list. Typing text alone is not enough — you must click a name in the drop-down, then save.

No lorries show up / I don't see my upload

- Check the **Date** box is set to the right day.
- Click ↻ **Refresh**.
- If you saw *"Upload sent, but no confirmation yet"*, wait a moment and refresh rather than uploading again — re-uploading can create a duplicate.

Imported the same lorry twice (duplicate card)

- Delete the extra card with **Delete** (see Step 4). Keep the one with the correct driver assigned.

Driver list won't load

- If the search picker is empty and you saw *"Could not load driver list..."*, refresh the page. If it's still empty, tell your supervisor — the staff list isn't reaching the page.

Can't reach the server

- If the list area shows "*Cannot reach server*" or "*Could not load*", check your internet, then click  **Refresh**. If it persists, report it.
